

## ENGR 2405 – Electrical Circuits I

### Laboratory #<N>: <Lab Title>

Name: Abdon Morales  
UT EID: am226923  
Date: July 30, 2026

---

## Description

<Brief description of the lab, taken from the lab assignment and put in your own words. State what circuit is built, what is measured, and what the lab is meant to demonstrate.>

## Procedure

1. <First step.>
2. <Second step.>
3. <Third step.>

## Calculations

<Set up the governing equations before any numbers go in.>

$$V = IR$$

```
1 // paste program here
2 R = [10 20 30];
3 Rseries = sum(R)
```

Listing 1: SciLab program.

```
Rseries =
    60.
```

Listing 2: SciLab runtime output.

## Simulations

Figure 1: LTspice schematic.

```
* paste netlist here
V1 N001 0 SINE(0 5 1k)
R1 N001 0 1k
.tran 5m
.end
```

Listing 3: LTspice netlist.

## Measurements

Table 1: Calculated and measured values.

| Quantity | Calculated | Measured | % Error |
|----------|------------|----------|---------|
| $V_1$    | < >        | < >      | < >     |
| $I_1$    | < >        | < >      | < >     |

Figure 2: Oscilloscope capture.

## Observations & Discussion

<Connected prose. Compare measured against calculated, explain the size and direction of any discrepancy, flag anything anomalous in the data, and answer the questions asked in the lab hand-out.>
